

Dear reader,

The BioGrace-II GHG calculation tool has been updated, you will find the updated tool on [this web page](#). The same page gives access to a pdf file which explains the changes made since the previous version 3 from 2015.

The updated version is "Version 4 - draft". It is published in September 2020 before the European Commission publishes a corrigendum to the RED-II and a number of implementing acts on the RED-II sustainability criteria. As a result, there is a chance that some details in the Excel tool and/or in the calculation rules or methodological background document will need to be changed as a result of the corrigendum plus the implementing acts.

"Version 4 - draft" will be replaced by version 4 after a period of testing by the users of the tool and by RVO itself. The publication of version 4 is scheduled for early 2021. In case you find any problems or think that the tool can be improved, then please contact us via [info@biograce.net](mailto:info@biograce.net).

This "version 4 - draft" contains the 2015 version 4d of the list of additional standard values. An updated list will be included in version 4.

You receive this mail as you have registered for the BioGrace news messages. You can unregister via [this web page](#).

This message is on the BioGrace-**II** GHG calculation tool on electricity, heat and cooling from biomass. The BioGrace-**I** GHG calculation tool on biofuels for transport is not yet being updated as (so far) there are no funds for doing so.

With kind regards,

John Neeft

.....
